March 5, 2019

$x_1$	$x_2$	$y$
0	0	0
0	1	1
1	0	1
1	1	0

We will work with Keras library (tensorflow backend). In order to have reproducible results, include at the top of your code:

```
import numpy
numpy.random.seed(123)
from tensorflow import set_random_seed
set_random_seed(123)
```

# 1 Data set

Build a data set for the XOR problem.

# 2 Model building

With sequential API, create a model of architecture:

- 1 layer of 4 fully connected units with hyperbolic tangent activation
- an appropriate output layer

**hint** do not forget to specify the input shape

# 3 Model fitting

Fit your model with 64 epochs of batches of size 4.

# 4 Model predictions

Give the resubstitution results (probability and classes), the confusion matrix from `keras.metrics.confusion_matrix()`. Then try to change learning rate to 5% and observe results.

		Actual		
		Class A	Class B	Class C
3* Predicted	Class A	100	0	0
	Class B	10	80	10
	Class C	5	5	90

Figure 1: Example of confusion matrix for interpretation
